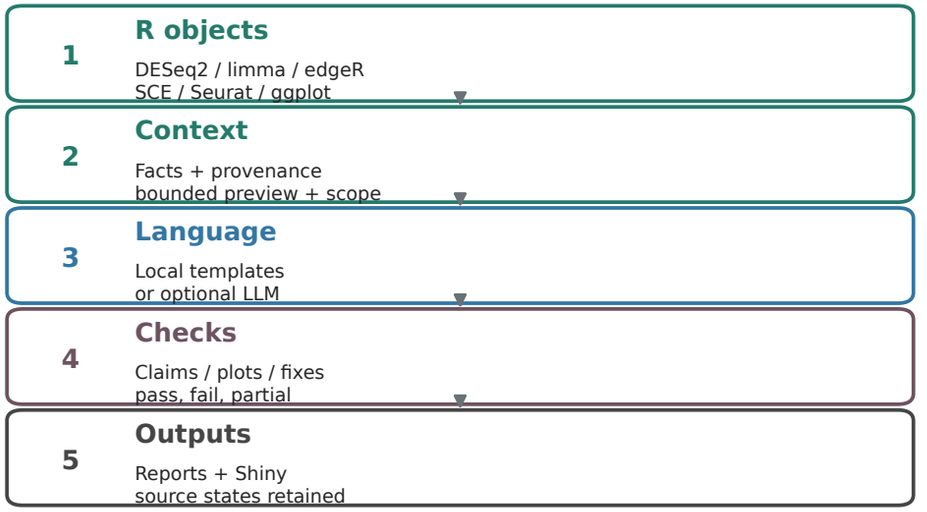
A Evidence-constrained workflow

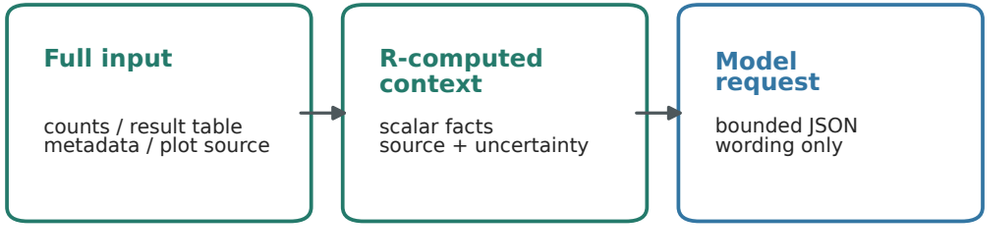
R computes facts; optional models organize bounded language



Full matrices stay in R; only bounded summaries cross the model interface.

B Data contract

What is computed, what is sent, and what is never delegated



Not delegated: full-table counting, statistical testing, raw-matrix access

Evidence retrieval is explicit opt-in and does not establish claim support.

C Validation states

Each check reports its scope; no global reliability score is implied

pass	specified value / mapping agrees
fail	specified value / mapping disagrees
partial	some checks available; value absent
unverified	no explicit machine-checkable claim

Facts, provenance, model wording and check status stay separate in reports.

D Local workbench

A reproducible session boundary for code, objects, explanations and reports

Per-browser session: state is retained locally; model never executes code.
