

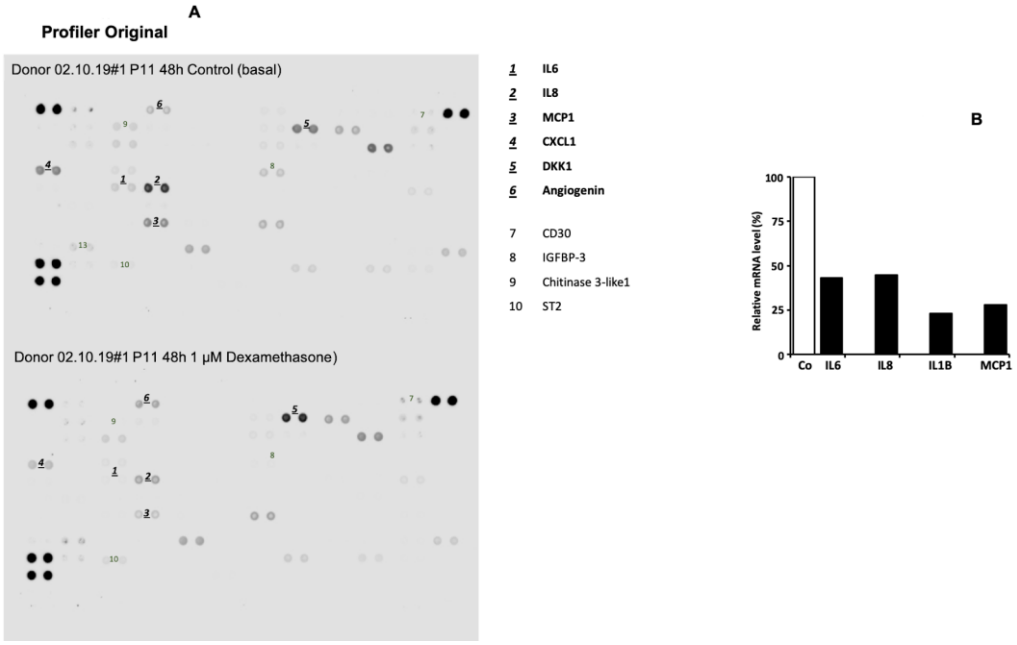

**Figure S1.** Original data showing cytokine profiler membranes and results in MKTPCs. (**A**) HTPCs treated with 1 µM Dex for 48 h responded with a decreased secretion of IL6, IL8, MCP1 and CXCL1 compared to untreated cells. Upper panel shows corresponding membrane spots of untreated control while lower panel depicts Dex (1 µM) treated HTPCs revealing a reduction of signal intensity of IL6, IL8, MCP1, CXCL1, chitinase 3-like 1 and IGFBP3 whilst dot intensity was increased for ANG, DKK1, ST2 and CD30. Dex = dexamethasone, Co = control (EtOH). Note that the dots in the lower left corners are reference spots used for normalization. (**B**) Quantitative PCR revealed decreased mRNA expression of *IL6*, *IL8*, *IL1B* and *MCP1* also in MKTPCs after 24 h stimulation with 1 µM Dex compared to control (n = 1).

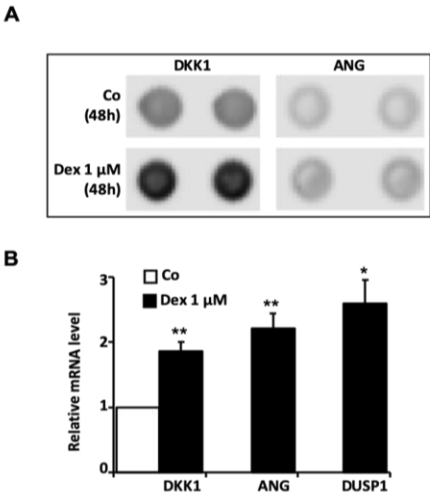

**Figure S2.** Activation of GR by Dex affected DKK1 and ANG. (**A**) Cultured HTPCs treated with 1 µM Dex for 48 h exhibited an increased secretion of DKK1 and ANG compared to untreated cells as revealed by a human cytokine profiler assay (n = 1). (**B**) Quantitative PCR corroborated significantly increased mRNA expression of *DKK1* and *ANG* (n = 6; $p < 0.05$) but also of *DUSP1* (n = 4) upon 24 h stimulation with 1 µM Dex. * $p \leq 0.05$, ** $p \leq 0.01$ vs. control cells. Dex = dexamethasone, Co = control (EtOH).

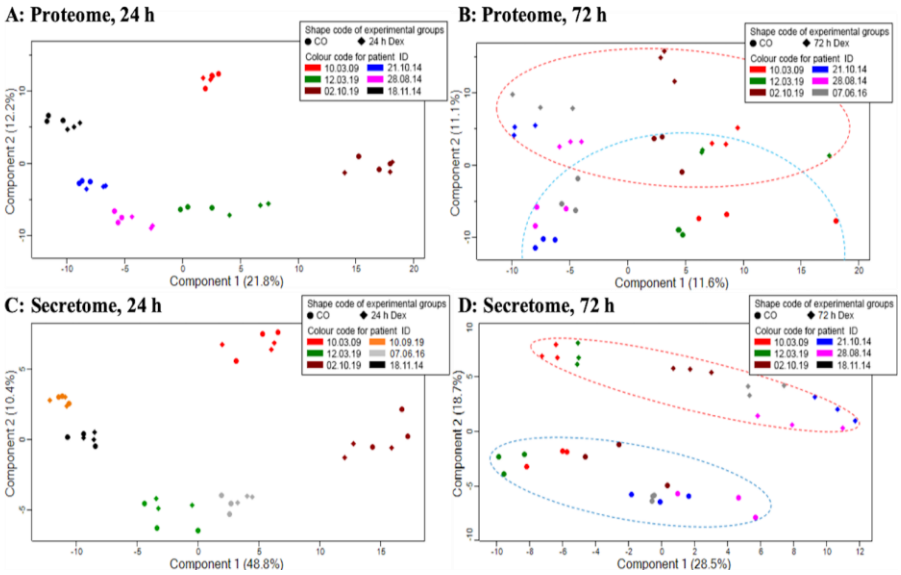

**Figure S3.** Principal component analysis (PCA) of 6 patients' cellular proteomes upon a 24 h (**A**) and a 72 h (**B**) incubation with 1 µM Dex, as well as respective secretomes upon a 24 h (**C**) and a 72 h (**D**) incubation with 1 µM Dex (per patient: 3x Dex vs 3x Co). Different dot colors encode the respective patient ID (a 6-digit code). Dex = dexamethasone, Co = control (EtOH).

**Table S1.** Primer sequences (5´-3´) used in real time PCR, amplicon, annealing temperature (AT) and accession number, *Callithrix jacchus* (cj).
